
Bars: mean (geometric mean on log axes); dots: seeds. p: each HMM vs K-means, paired t-test if Shapiro-Wilk p > 0.05 on the differences, else Wilcoxon signed-rank. n = 5 seeds (exact two-sided Wilcoxon p cannot fall below 0.0625). Transitions and dwell times tested as |log2 ratio| (distance to the truth); fit time on log10 seconds.
